

Flexible Method 5

The Apex Instruments Isokinetic **Convertible Method 5 Intermediate Sampler System (SY5-CIS)** is our most versatile system allowing the tester to use in the flexible or the rigid arrangement. Due to the non-standardized design of stacks and testing locations, arrangement of stack testing equipment is often a difficult task. In the flexible arrangement, this convertible system enables the tester to easily and efficiently setup for these challenging environments, such as vertical traverses and space-limited areas. The **miniature heated filter box (SB-2M)** coupled with our unique **riser (SBR-10)** quickly converts the flexible system to the standard, rigid arrangement. The deluxe glassware set allows efficient turnaround between runs.
